

## Using the lesson links in Pytch

Each of the 7 lessons has a unique link. For example, for lesson 4 the link is: <https://pytch.org/app/lesson/sbys/4>. That link takes you to a special page on the Pytch site.

### Opening a lesson for the first time

When you or the students click on the link, they will be taken to a runnable project related to the corresponding lesson. At the left of the code section, you will find the name of the lesson so you know you are in the right place:

### Opening a lesson for subsequent times

If you click on the lesson link a second time having made changes, Pytch will give you the choice to choose if you would like to open a fresh copy of the lesson's code or if you would like to open one of your previous edited versions. In this way you can return to your work, or start over. (If you have made many changes this is a way to 'reset' your project.)

If the students are working with a lesson's *Worksheet 2* (investigate activity), they will frequently need to start again (once every new question). If students are working on *Worksheet 3* (tasks), they might want to open a previous version with the previous task already resolved and continue modifying and making their own project from there. In the example below (overleaf) you can see that this student can either start over, or can select some version they saved recently or a while ago. These versions are saved on your computer, so if you return to Pytch some days later, you must be using the same computer to access them. (It is also possible to save projects to a zip file or to Google drive from within Pytch itself.)
